

TABLE OF SUGGESTED DOSES FOR LTX 777

How to calculate the right quantity of LTX777 sealant to be used for the tyres of your bicycle.

Let's start considering:

- Tyre dimension, section and diameter.
- Tyre features: tubeless, tubeless ready, tubular or with inner tube.

Do not also forget the importance of weather conditions, such as humidity, temperature and the frequency of bicycle use.

With this in mind, Super Help Technicians have decided to calculate and provide the recommended sealant quantity/ doses in the table as here below indicated.

Read carefully the tyre size as written on the side walls of the same. (diameter, width..etc), recognize the tyre type, if tubeless, tubular, tubeless-ready or with tube) understanding in this way which is the right dose of LTX777 sealant to be injected into the tyre.

Sealant lifespan inside the tyres is directly related to the quantity used. By reducing the quantity of sealant, not only its ability to repair punctures, but also its lifespan, will be reduced.

Bike riders must consider that the sealant is influenced by different weather related factors, such as temperature. For instance, as the temperature increases, so does the sealant evaporation, thus resulting in a shorter lifespan.

For this reason, Super Help Technicians strongly recommend regular checks and top-ups of the sealant and they suggest :

- To verify the quantity of the sealant inside the tyre every two months.
- To top up, adding the correct quantity of sealant, every two months.
- To spin the tyre every day, for a few seconds for a better result.

LTX777 a "SUPER HELPING " product for your fun on bike.
